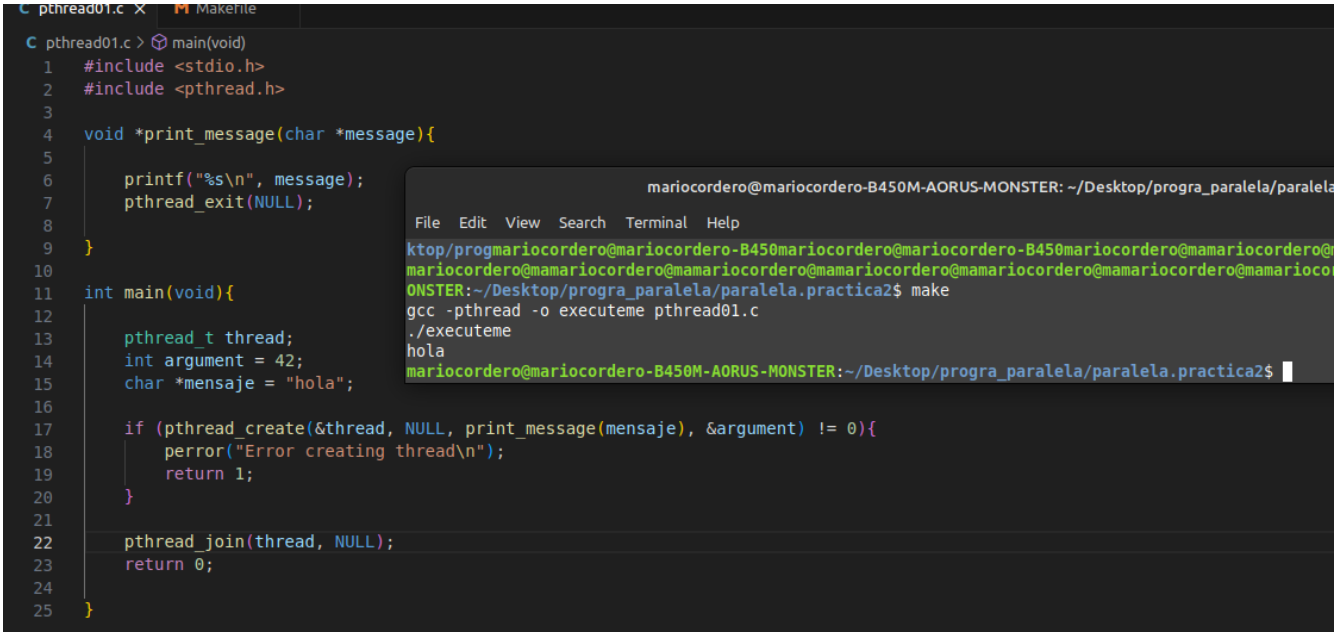
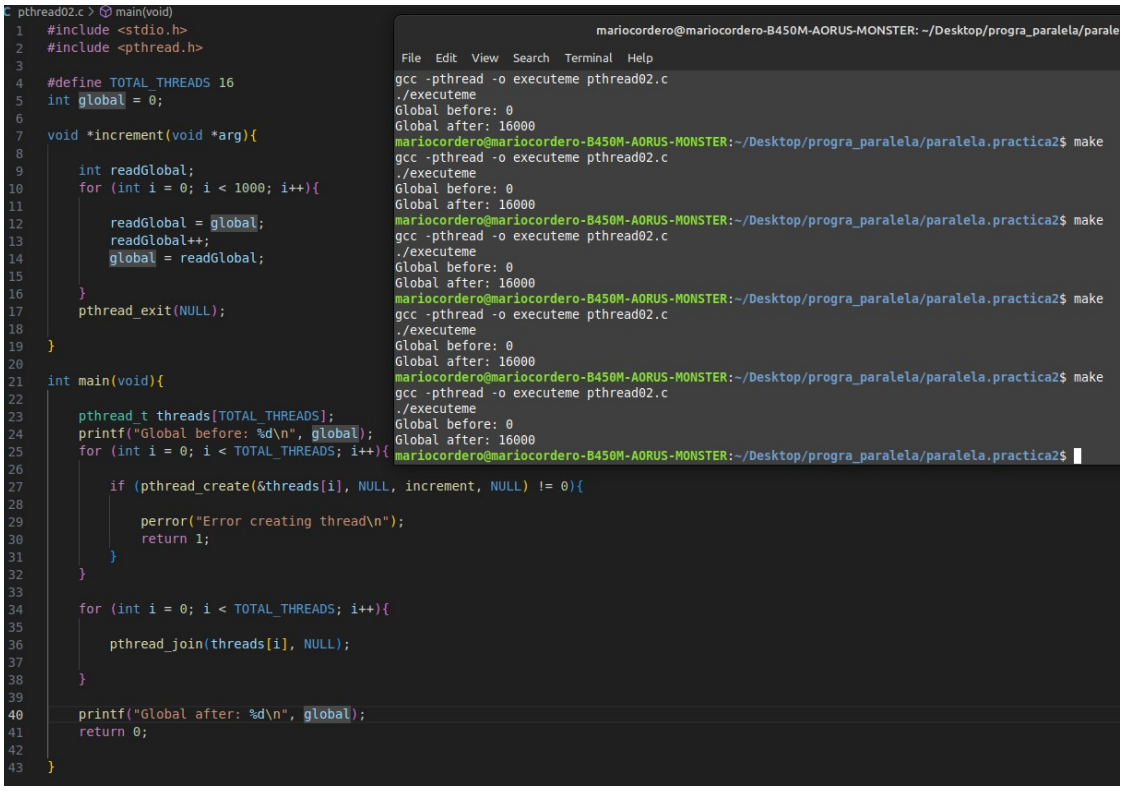
REPORTE

PRIMERA PARTE

Nota: Cabe destacar que hay que enviar una cadena por parametro a la funcion para que todo esto funcione :D



SEGUNDA PARTE



```c
#include <stdio.h>
#include <pthread.h>

#define TOTAL_THREADS 16
int global = 0;

void *increment(void *arg){

    int readGlobal;
    for (int i = 0; i < 1000; i++){

        readGlobal = global;
        readGlobal++;
        global = readGlobal;

    }
    pthread_exit(NULL);

}

int main(void){

    pthread_t threads[TOTAL_THREADS];
    printf("Global before: %d\n", global);
    for (int i = 0; i < TOTAL_THREADS; i++){

        if (pthread_create(&threads[i], NULL, increment, NULL) != 0){

            perror("Error creating thread\n");
            return 1;
        }
    }

    for (int i = 0; i < TOTAL_THREADS; i++){

        pthread_join(threads[i], NULL);

    }

    printf("Global after: %d\n", global);
    return 0;

}
```

```

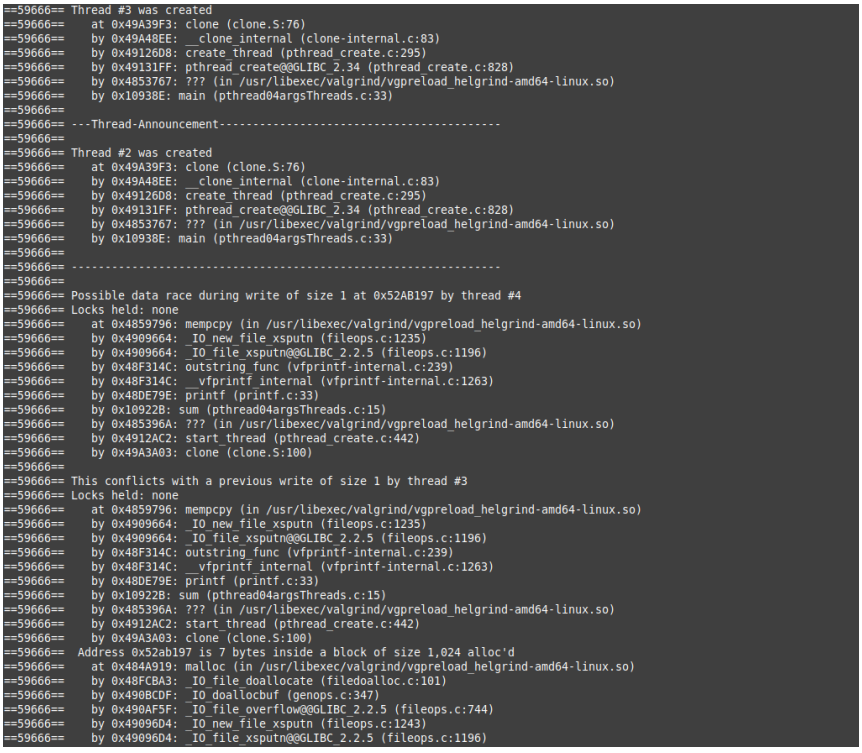
==40625== For lists of detected and suppressed errors, rerun with: -s
==40625== ERROR SUMMARY: 0 errors from 0 contexts (suppressed: 0 from 0)
```

0 errores con valgrind. Noto que es capaz de enviarle argumentos por medio de Structs al hilo para que este pueda operar con el, me imagino que esto va muy orientado a la programación orientada a objetos y como un hilo puede operar con uno.

Paso de argumentos a múltiples hilos



```

```

Hice structs manualmente con argumentos distintos para empezar a sumarlos, Valgrind me indica que dos o más hilos están escribiendo en la misma ubicación de memoria al mismo tiempo sin sincronización. En este caso, los hilos parecen estar escribiendo en la salida estándar al mismo tiempo, sin control alguno, lo que llega a causar desincronizaciones o salidas incoherentes. La solución ahorita creo sería un Mutex en la función para que espere a los otros hilos y estén sincronizados.

```
